External Routing (BGP and MP-BGP)

Arquitectura de Comunicações

Border Gateway Protocol (BGP)

- Border Gateway Protocol Version 4 of the protocol (BGP4) was deployed in 1993 and currently is the protocol that assures Internet connectivity
- BGP is mainly used for routing between Autonomous Systems
- Autonomous System (AS) is a network under a single administration
 - One or more network operators with a common well defined global routing policy

AS Numbers

- Allocated ID by InterNIC and is globally unique
- RFC 4271 defines an AS number as 2-bytes
 - Private AS Numbers = 64512 through 65535
 - Public AS Numbers = 1 through 64511
 - 39000+ have already been allocated
 - We will eventually run out of AS numbers
- Need to expand AS size from 2-bytes to 4-bytes
- RFC4893 defines BGP support for 4-bytes AS numbers
 - 4,294,967,295 AS numbers
 - As of January 1, 2009, all new Autonomous System numbers issued will be 4-byte by default, unless otherwise requested.
 - The full binary 4-byte AS number is split two words of 16 bits each
 - Notation:
 - <higher2bytes in decimal>.<lower2bytes in decimal>
 - Example1: AS 65546 is represented as "1.10"
 - Example2: AS 50000 is represented as "0.50000"
 - Cannot have a "flag day" solution

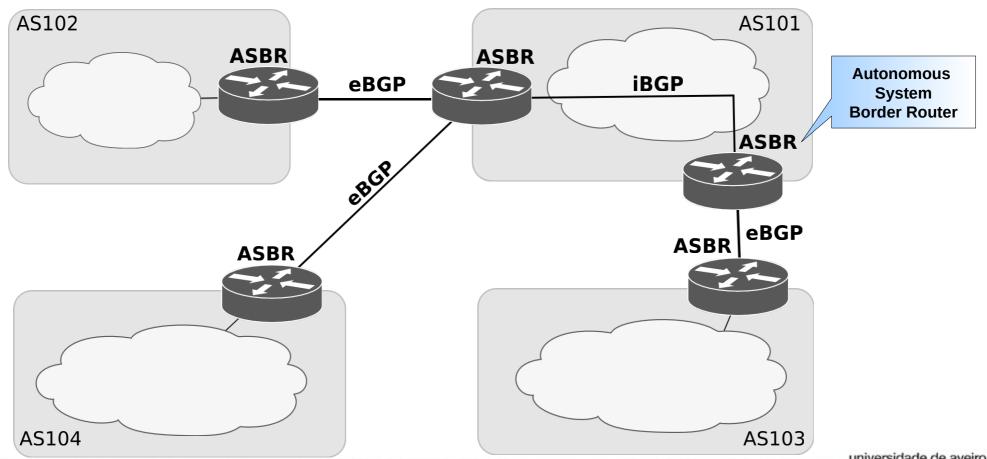

BGP Neighbor Relationships

- Often called peering
 - Usually manually configured into routers by the administrator
- Each neighbor session runs over TCP (port 179)
 - Ensures reliable data delivery
- Peers exchange all their routes when the session is first established
- Updates are also sent when there is a topology change in the network or a change in routing policy
- BGP peers exchange session KEEPALIVE messages
 - To avoid extended periods of inactivity.
 - Low keepalive intervals can be set if a fast fail-over is required

Internal BGP (iBGP) & External BGP (eBGP)

- Neighbor relations can be established between
 - Same AS routers (Internal BGP iBGP).
 - Different AS routers (External BGP eBGP).
- Routers that implement neighbor relations are called an Autonomous System Border Router (ASBR).

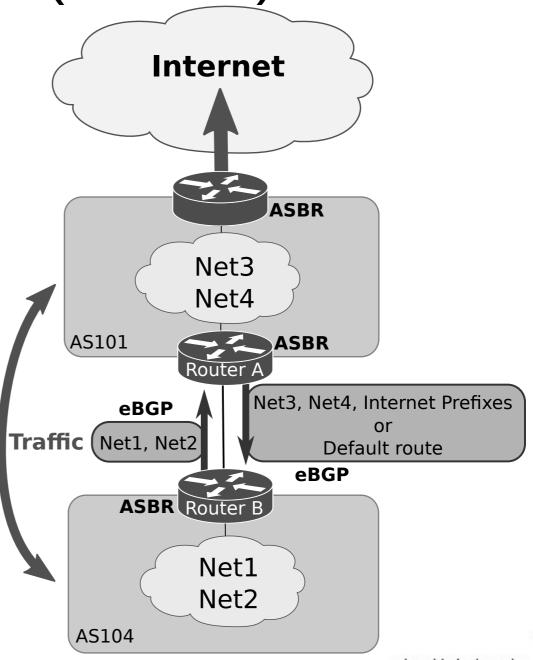

External and Internal BGP

- External BGP (eBGP) is used between AS.
- Internal BGP (iBGP) is used within AS.
- A BGP router never forwards a path learned from one iBGP peer to another iBGP peer even if that path is the best path.
 - An exception is when a router is configured as route-reflector.
- A BGP forward the routes learned from one eBGP peer to both eBGP and iBGP peers.
 - Filters can be used to modify this behavior.
- iBGP routers in an AS must maintain an iBGP session with all other iBGP routers in the AS (iBGP Mesh).
 - To obtain complete routing information about external networks.
 - Most networks also use an IGP, such as OSPF.
 - Additional methods can be used to reduce iBGP Mesh complexity.
 - Route reflectors, private AS, ...

Single-homed (or Stub) AS

- AS has only one border router (ASBR)
 - Single Internet access.
 - Single ISP.

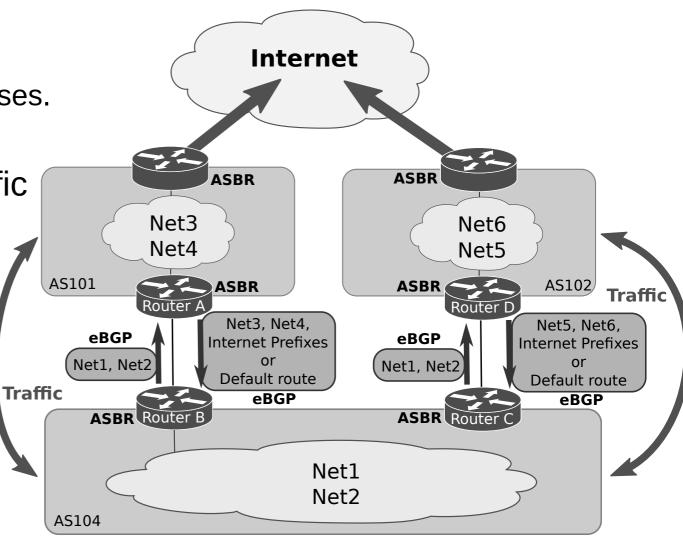

Multi-homed Non-transit AS

 AS has more than one border router (ASBR)

Multiple Internet accesses.

Multiple ISP.

 Does not transport traffic from other AS.

Multi-homed Transit AS

 AS has more than one border router (ASBR).

Multiple Internet accesses.

Multiple ISP.

 Transports traffic from other AS.

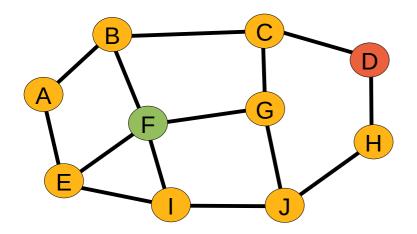

Traffic

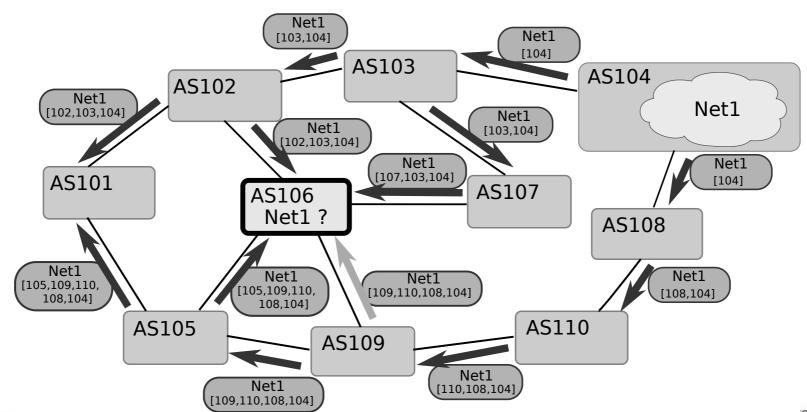

Path-vector

- BGP is a path-vector protocol
- Although it is essentially a distance-vector protocol that carries a list of the AS traversed by the route
 - Provides loop detection
- An EBGP speaker adds its own AS to this list before forwarding a route to another EBGP peer
- An IBGP speaker does not modify the list because it is sending the route to a peer within the same AS
 - AS list cannot be used to detect the IBGP routing loops

Path vector

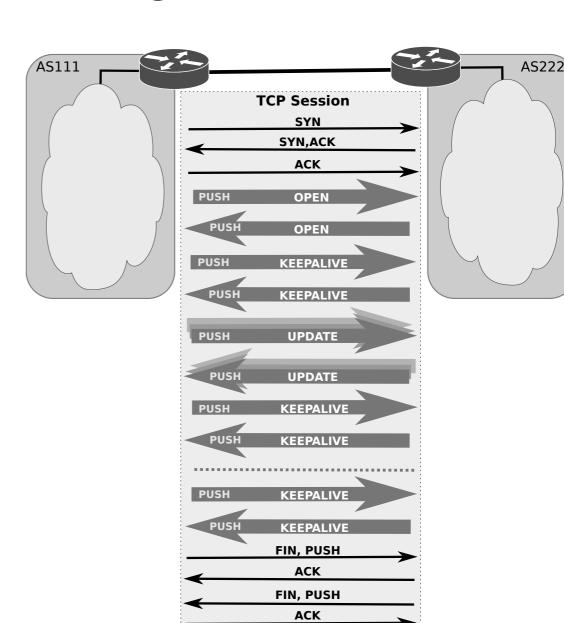

- F receives from its neighbors different paths to D:
 - De B: "I use BCD"
 - De G: "I use GCD"
 - De I: "I use IFGCD"
 - De E: "I use EFGCD"

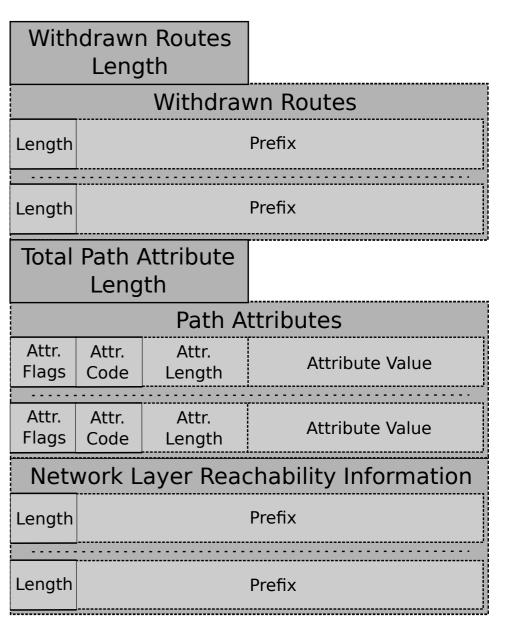

BGP Messages

- OPEN messages are used to establish the BGP session.
- UPDATE messages are used to send routing prefixes, along with their associated BGP attributes (such as the AS-PATH).
- KEEPALIVE messages are exchanged whenever the keepalive period is exceeded, without an update being exchanged.
- NOTIFICATION messages are sent whenever a protocol error is detected, after which the BGP session is closed.

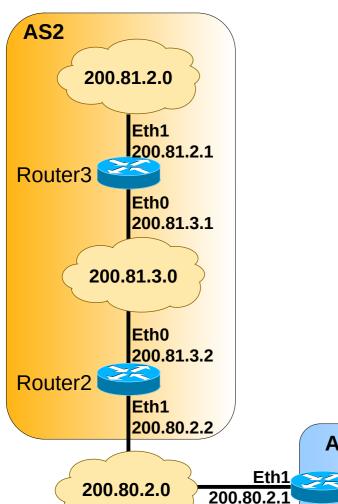

Update Message

- Withdrawn routes List of IP networks no longer accessible.
- Path attributes parameters used to define routing and routing policies.
- Network layer reachability information – List of IP networks with connectivity.

Example

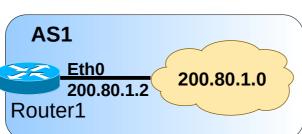

- C 200.81.3.0/24 is directly connected, Ethernet0
- O 200.81.2.0/24 [110/20] via 200.81.3.1, 00:01:12
- C 200.80.2.0/24 is directly connected, Ethernet1
- B 200.80.1.0/24 [20/0] via 200.80.2.1, 00:00:29

Router 2's routing table

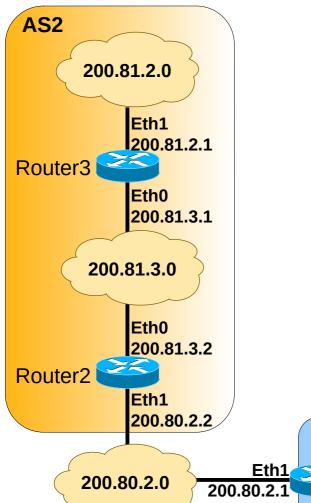

- B 200.81.3.0/24 [20/0] via 200.80.2.2, 00:01:58
- B 200.81.2.0/24 [20/0] via 200.80.2.2, 00:01:57
- C 200.80.2.0/24 is directly connected, Ethernet1
- C 200.80.1.0/24 is directly connected, Ethernet0

Router 1's routing table

Example – BGP networks aggregation

Operador prefere rede mais pequena ou seja mask maior

Before aggregation

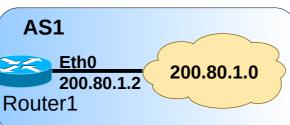

- 200.81.3.0/24 20/0] via 200.80.2.2, 00:01:58
- 200.81.2.0/24 [20/0] via 200.80.2.2, 00:01:57
- 200.80.2.0/24 is directly connected, Ethernet1
- 200.80.1.0/24 is directly connected, Ethernet0

Router 1

After aggregation

- 200.81.2.0/23 20/0] via 200.80.2.2, 00:01:06
- 200.80.2.0/24 is directly connected, Ethernet1
- 200.80.1.0/24 is directly connected, Ethernet0

Router 1

BGP Attributes

- A BGP attribute, or path attribute, is a metric used to describe the characteristics of a BGP path.
- Attributes are contained in update messages passed between BGP peers to advertise routes. There are 4+1 categories of BGP attributes.
 - Well-known Mandatory (included in BGP updates)
 - AS-path, Next-hop, Origin.
 - Well-known Discretionary (may or may not be included in BGP updates)
 - Local Preference, Atomic Aggregate.
 - Optional Transitive (may not be supported by all BGP implementations)
 - Aggregator, Community, AS4_Aggregator, AS4_path.

à routers que n aguentam 4 bytes

- Optional Non-transitive (may not be supported by all BGP implementations)
 - If the neighbor doesn't support that attribute it is deleted
 - Multi-exit-discriminator (MED).
- Cisco-defined (local to router, not advertised)
 - Weight

AS-PATH and ORIGIN Attributes

AS-PATH

 When a route advertisement passes through an autonomous system, the AS number is added to an ordered list of AS numbers that the route advertisement has traversed.

ORIGIN

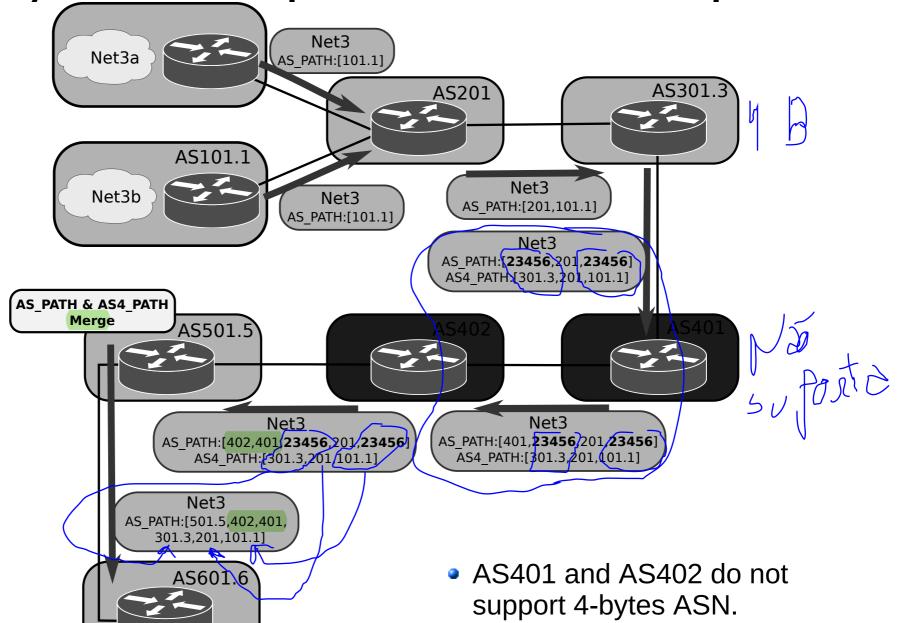

- Indicates how BGP learned about a particular route. Can take three possible values:
 - → IGP (0) value is set if the route is interior to the originating AS, resulting from an explicit inclusion of a network within the BGP routing process by means of manual configuration.
 - INCOMPLETE (2) value is set if the route is learned by other means, namely, route redistribution from other routing processes into the BGP routing process.
 - → EGP (1) is no longer used in modern networks.

AS4_PATH & AS4_AGGREGATOR

- AS4_PATH attribute has the same semantics as the AS_PATH attribute, except that it is optional transitive, and it carries 4-bytes AS numbers.
- AS4_AGGREGATOR attribute has the same semantics as the AGGREGATOR attribute, except that it carries a 4-bytes AS number.
- 4-byte AS support is advertised via BGP capability negotiation
 - Speakers who support 4-byte AS are known as NEW BGP speakers
 - Those who do not are known as OLD BGP speakers
- New Reserved AS number
 - AS_TRANS = AS 23456
 - 2-byte placeholder for a 4-byte AS number
 - Used for backward compatibility between OLD and NEW BGP speakers
- Receiving UPDATEs from a NEW speaker
 - Decode each AS number as 4-bytes
 - AS_PATH and AGGREGATOR are effected
- Receiving UPDATEs from an OLD speaker
 - AS4_AGGREGATOR will override AGGREGATOR
 - AS4_PATH and AS_PATH must be merged to form the correct as-path
- Merging AS4 PATH and AS PATH
 - AS_PATH → [275 250 225 23456 23456 200 23456 175]
 - AS4_PATH → [100.1 100.2 200 100.3 175]
 - Merged AS-PATH → [275 250 225 100.1 100.2 200 100.3 175]

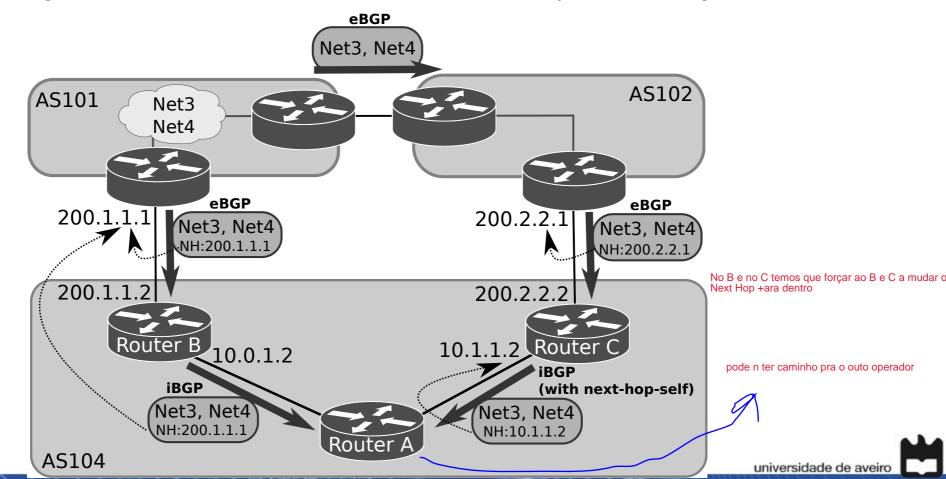

4-bytes AS Operational Example

substitui 23456

Next-Hop Attribute

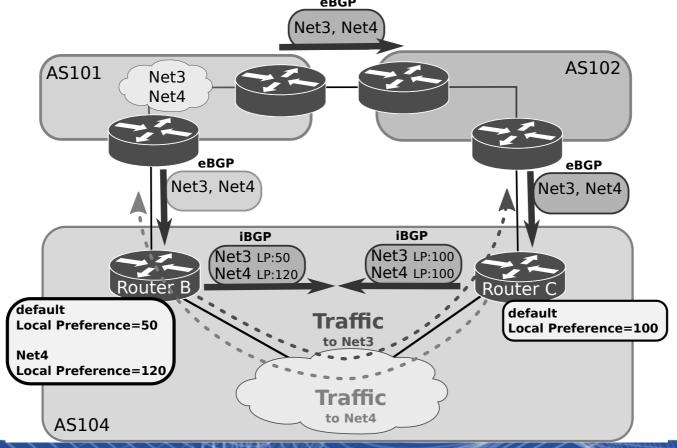

- The eBGP next-hop attribute is the IP address that is used to reach the advertising router
- For eBGP, the next-hop address is the IP address of the connection between the peers
- For iBGP, the eBGP next-hop address is carried into the local AS
 - By configuration the AS border router can be the next-hop to iBGP neighbors

Local Preference Attribute

N passa para fora

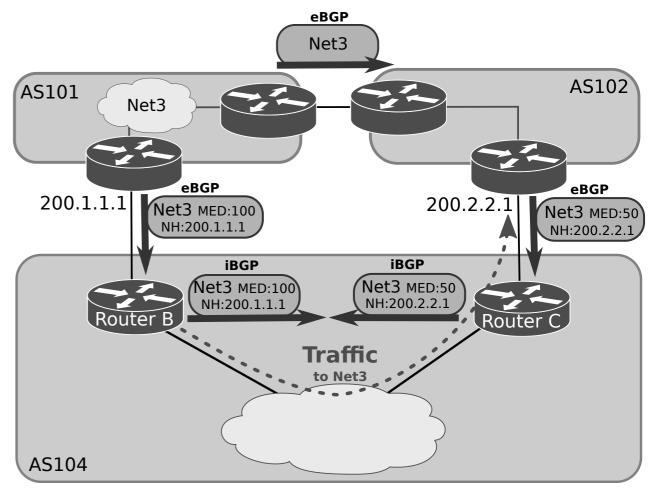

- The local preference attribute is used to choose an exit point from the local autonomous system (AS).
 - Higher value is preferred.
- The local preference attribute is propagated throughout the local AS.
- Can be different. for different routes.

Multi-Exit Discriminator Attribute (MED)

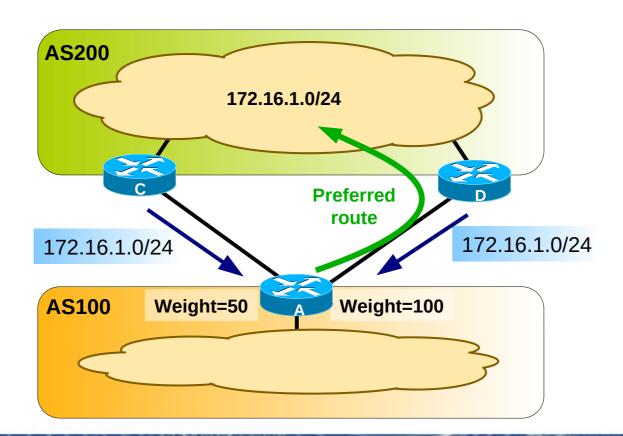

em vez de dizer o que prefiro é o meu vizinho a dizer o que prefere que eu faça

- The multi-exit discriminator (MED) or metric attribute is used as a suggestion to an external AS.
- The external AS that is receiving the MEDs may be using other BGP attributes for route selection.
- The lower value of the metric is preferred.
- MED is designed to influence incoming traffic.

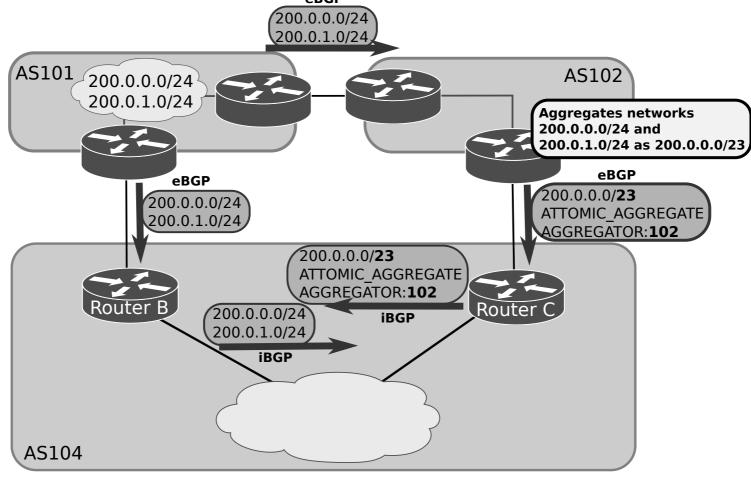

Weight Attribute

- Weight is a Cisco-defined attribute that is local to a router.
- The weight attribute is not advertised to neighboring routers.
- If the router learns about more than one route to the same destination, the route with the highest weight will be preferred.

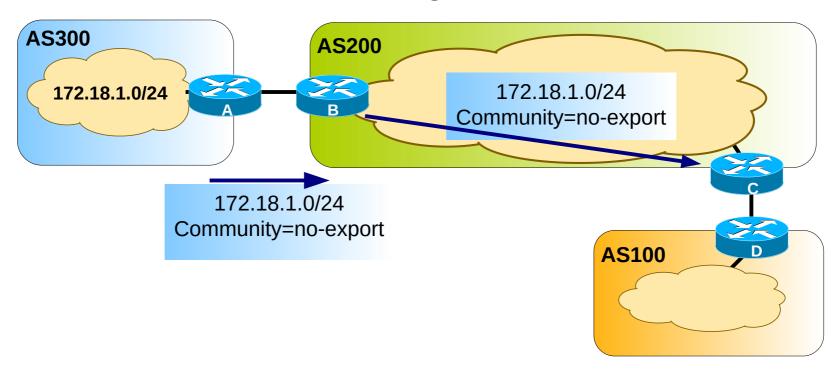

Atomic Aggregate and Aggregator Attributes

- Atomic Aggregate
 - Is used to alert routers that specific routes have been aggregated into a less specific route.
 - When aggregation like this occurs, more specific routes are lost.
- Aggregator
 - Provides information about which AS performed the aggregation.
 - And the IP address of the router that originated the aggregate.

Community Attribute

- Used to group routes that share common properties so that policies can be applied at the group level
- Predefined community attributes are:
 - no-export Do not advertise this route to EBGP peers
 - no-advertise Do not advertise this route to any peer
 - internet Advertise this route to the Internet community; all routers in the network belong to it
 - General communities format is ASnumber: Cnumber
 - e.g. 300:1, 200:38, etc...

BGP Path Selection

- BGP may receive multiple advertisements for the same route from multiple sources.
- BGP selects only one path as the best path.
- BGP puts the selected path in the IP routing table and propagates the path to its neighbors. BGP uses the following criteria, in the order:
 - Largest weight (Cisco only)
 - Largest local preference
- Path that was originated locally
 - Shortest path passa por menos AS
 - Lowest origin type (IGP lower than EGP, EGP lower than incomplete)
 - Lowest MED attribute
 - Prefer the external path over the internal path
 - Closest IGP neighbor

Multi-Protocol Border Gateway Protocol (MP-BGP)

MP-BGP Description

- Extension to the BGP protocol
- Carries routing information about other protocols/families:
 - IPv6 Unicast
 - Multicast (IPv4 and IPv6)
 - 6PE IPv6 over IPv4 MPLS backbone
 - Multi-Protocol Label Switching (MPLS) VPN (IPv4 and IPv6)
- Exchange of Multi-Protocol Reachability Information (NLRI)

MP-BGP Attributes

- New non-transitive and optional attributes
 - MP_REACH_NLRI
 - Carry the set of reachable destinations together with the next-hop information to be used for forwarding to these destinations
 - MP_UNREACH_NLRI
 - Carry the set of unreachable destinations
- Attribute contains one or more triples
 - Address Family Information (AFI) with Sub-AFI
 - Identifies protocol information carried in the Network Layer Reachability Information
 - Next-hop information
 - Next-hop address must be of the same family
- Reachability information

MP-BGP Negotiation Capabilities

- MP-BGP routers establish BGP sessions through the OPEN message
 - OPEN message contains optional parameters
 - If OPEN parameters are not recognized, BGP session is terminated
 - A new optional parameter: CAPABILITIES
- OPEN message with CAPABILITIES containing:
 - Multi-Protocol extensions (AFI/SAFI)
 - Route Refresh
 - Outbound Route Filtering

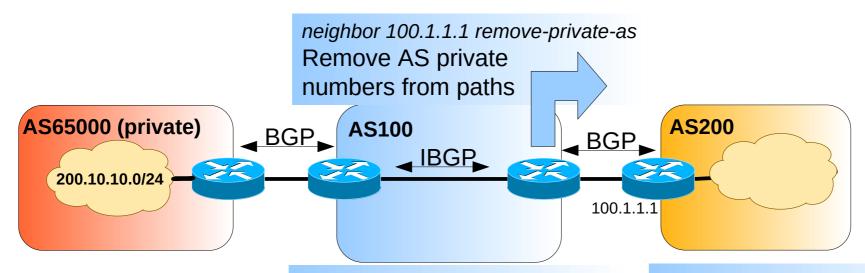

MP-BGP New Features for IPv6

- IPv6 Unicast
 - MP-BGP enables the creation of IPv6 Inter-AS relations
- IPv6 Multicast
 - Unicast prefixes for Reverse Path Forwarding (RPF) checking
 - RPF information is disseminated between autonomous systems
 - Compatible with single domain Rendezvous Points or Protocol Independent Multicast-Source Specific Multicast (PIM-SSM)
 - Topology can be congruent or non-congruent with the unicast one
- IPv6 and label (6PE)
 - IPv6 packet is transported over an IPv4 MPLS backbone
- IPv6 VPN (6VPE)
 - Multiple IPv6 VPNs are created over an IPv4 MPLS backbone
 - Layer 2 VPN

Advanced BGP

Private BGP AS

- Private autonomous system (AS) numbers range from 64512 to 65535
- When a customer network is large, the ISP may assign an AS number:
 - Permanently assigning a Public AS number in the range of 1 to 64511
 - Should have a unique AS number to propagate its BGP routes to Internet
 - Done when a customer network connects to two different ISPs, such as multihoming
 - Assigning a Private AS number in the range of 64512 to 65535.
 - → It is not recommended that you use a private AS number when planning to connect to multiple ISPs in the future

200.10.10.0/24 Path: [65000 i]

200.10.10.0/24 Path: [100 i]

From RIPE database http://www.db.ripe.net

BGP Synchronization

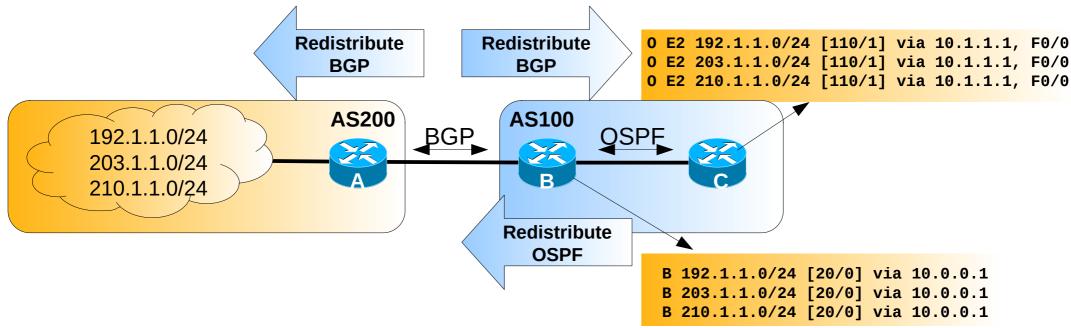

- Synchronization states that, if your AS passes traffic from another AS to a third AS, BGP should not advertise a route before all the routers in your AS have learned about the route via IGP.
- BGP waits until IGP has propagated the route within the AS.
 Then, BGP advertises the route to external peers.

BGP Route Reflectors

- Without a route reflector, the network requires a full iBGP mesh within AS300.
- The route reflector and its clients are called a cluster.
 - Router A is configured as a route reflector, iBGP peering between Routers B and C (and others) is not required.
 - Router D is configured as a route reflector, iBGP peering between Routers E and F (and others) is not required.
- Full IBGP mesh between route reflector Routers.

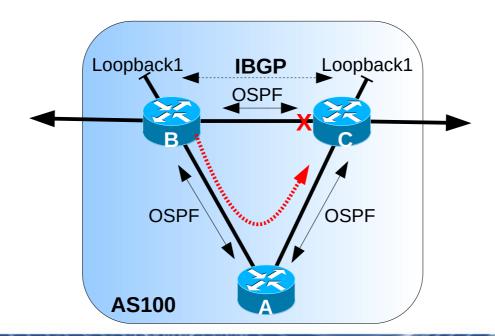

Routes Redistribution

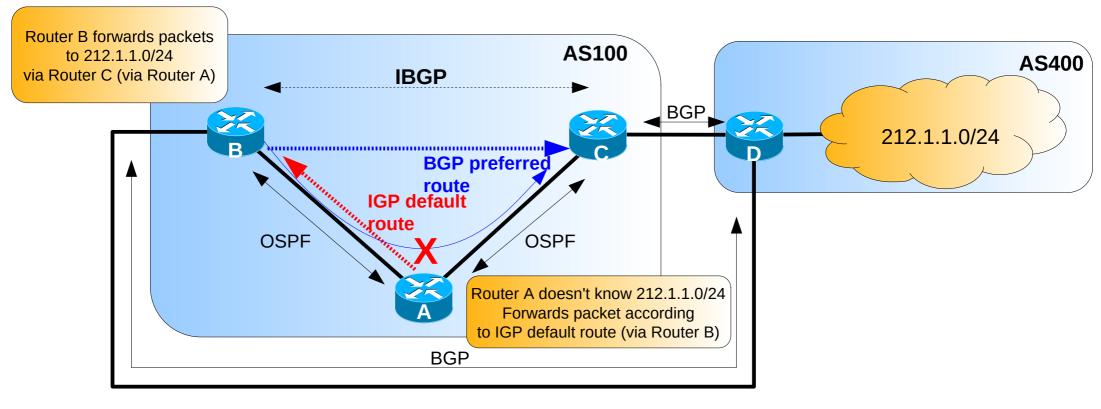

- Redistributing IGP routes by BGP will:
 - Simplify BGP configuration (advantage)
 - And BGP will announce only internal networks with connectivity (advantage)
- Redistributing BGP routes by IGP protocols will:
 - Make internal routes know all external routes (disadvantage/advantage?)
 - Increase routing tables size in internal routers (disadvantage)
 - → Decrease routing time, imposes memory requirements, ...
 - Avoid the usage of internal default routes (disadvantage/advantage?)

BGP Neighborhood Resilience

- BGP neighbor relations between physical interfaces are dependent on interface stability/status
- (Virtual) neighbor relations using Loopback interfaces/addresses
 - Loopback interfaces are virtual and software based
 - → If the router is active Loopback interfaces are always active
 - Neighbor relation is active while a path exists between the virtual networks
 - (Alternative) Routing provided by IGPs

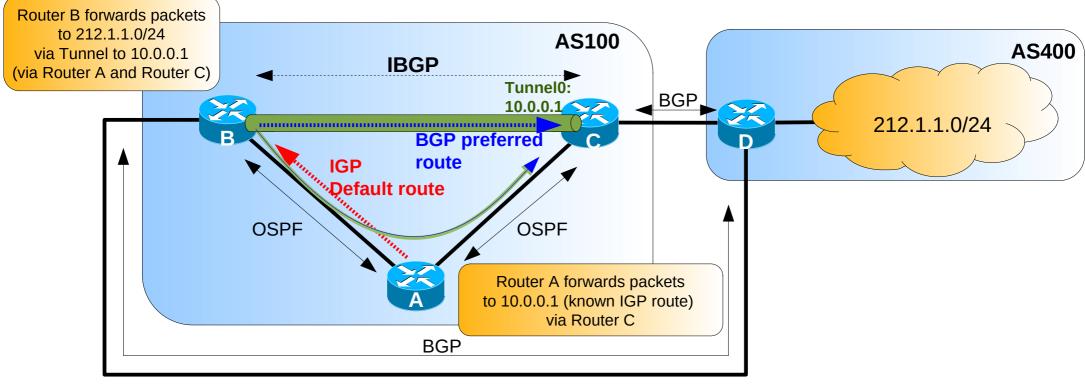

BGP and IGP conflicts

- Routing conflicts may arise with
 - Internal routers without BGP
 - No redistribution of BGP routes by IGP
 - IGP default routes
 - BGP preferred routes (with no agreement with IGP default routes)
- Solutions
 - Adjust IGP default routes
 - Adjust BGP preferred routes (e.g. with local preference)
 - BGP neighborhood and Internal routing via IP-IP tunnels

BGP over Tunnels (over IGP)

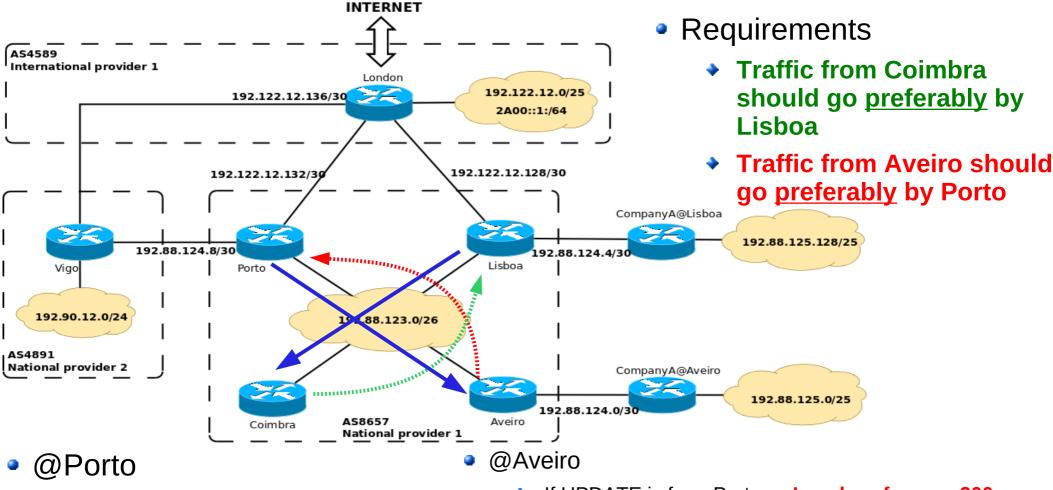

- IP-IP tunnels to solve BGP/IGP routing conflicts
 - Tunnels manually configured
 - Between physical or Loopback interfaces
 - BGP neighborhood via Tunnel
 - BGP routes learned via Tunnel (next hop is remote Tunnel end-point)
 - Tunnel "network" distributed internally via IGP
- In Router A, to any packet destined to an outside network it's forwarded via Tunnel
 - A new IP header is added, new IP destination address is the remote Tunnel end-point
 - Internally, packet is routed according to the new IP header (Tunnel end-points IP addresses)

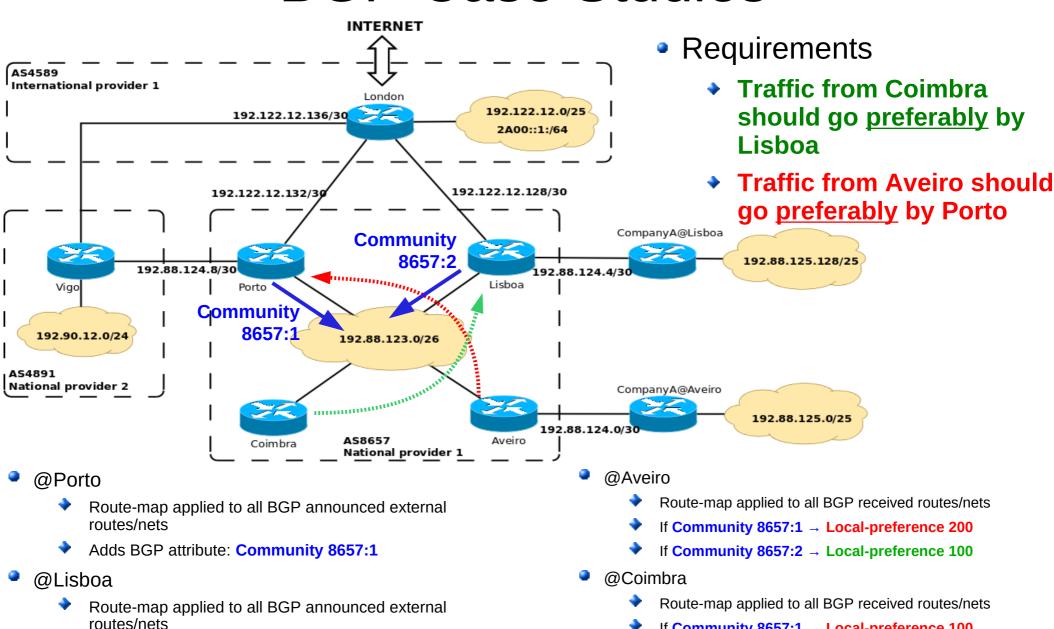

BGP Filtering and Route Maps

- Sending and receiving BGP updates can be controlled by using a number of different filtering methods.
- BGP updates can be filtered based on:
 - Route information,
 - Path information,
 - Communities.
- Route maps are used with BGP to
 - Control and modify routing information.
 - Define the conditions by which routes are redistributed between routing domains.

- Nothing to do besides peering!
- @Lisboa
